The nesting structure is defined by "subjects" (level-one units) being nested in "objects" (level-two units). Each subject provides responses on a set of m dichotomous items with regard to the object in which this subject is nested.

Multilevel Analysis by Tom Snijders and Roel Bosker Chapter 4: The Random Intercept Model | SAS Textbook Examples. In this chapter we create and use the variables `GndC_verb` which is equal to `iq_verb` centered around the grand mean; `GrpMC_verb` which contains the group means of `GndC_verb`, so it contains the group means of `iq_verb` centered around the grand mean.

Snijders also gives a didactic example of this concept (page 18).² When the ICC is 0, the suitability of performing a multilevel analysis is less obvious. In the absence of a multilevel structure, a single level individual analysis is appropriate. We may be interested in knowing if the ICC is statistically different from 0.

Multilevel Analysis may be understood to refer broadly to the methodology of research questions and data structures that involve more than one type of unit. This originated in studies involving several levels of aggregation, such as individuals and counties, or pupils, classrooms, and schools.
